At Dynamic Ratings, customer service and support is the core of our business. From the start we work closely with you to create and define standards to ensure that your system is implemented consistently regardless of the age, make or model of electrical assets being monitored. This approach makes installation, support and use of the system easier.

Dynamic programming is both a mathematical optimization method and a computer programming method. The method was developed by Richard Bellman in the 1950s and has found applications in numerous fields, from aerospace engineering to economics.. In both contexts it refers to simplifying a complicated problem by breaking it down into simpler sub-problems in a recursive manner.

The course covers the basic models and solution techniques for problems of sequential decision making under uncertainty (stochastic control). We will consider optimal control of a dynamical system over both a finite and an infinite number of stages. This includes systems with finite or infinite state spaces, as well as perfectly or imperfectly observed systems.

When the term “dynamic range” is mentioned, many people will quickly think of HDR, or “High Dynamic Range.” With this term, and technique, so popular in the world of photography, it is rarely ever considered what dynamic range actually is, let alone why you would want it to be “high.” In short, dynamic range describes the measurement between maximum and minimum values.
