Solution: Manually Call Execution Strategy. The solution is to manually use the execution strategy and give it the entire set of logic to be run, so that it can retry everything if one of the operations fails. When an execution strategy derived from DbExecutionStrategy is running it will suspend the implicit execution strategy used in SaveChanges.

In order to calculate the activity of an ion C in a solution, one must know the concentration and the activity coefficient: $a_C = \gamma_C [C]$, where γ_C is the activity coefficient of C, $[C]$ is the concentration of the chosen standard state, e.g. 1 mol/kg if molality is used, $[C]$ is a measure of the concentration of C. Dividing a_C with $[C]$ gives a dimensionless quantity.. The Debye-Hückel limiting law enables ...
