What's on the meter indicates two phases at 30A maximum per phase. It was probably two-phase to support the stove, with everything else on the other phase. And adding 2 x 1100W, about 9A, could easily put the other phase under close to its maximum rated load if its already supporting everything other than the stove.

Two-phase electrical power was an early 20th-century polyphase alternating current electric power distribution system. Two circuits were used, with voltage phases differing by one-quarter of a cycle, 90°. Usually circuits used four wires, two for each phase. Less frequently, three wires were used, with a common wire with a larger-diameter conductor.
