Rectangular Waveguide To Coax Transition

nas normally use waveguide techniques. A typical transition consists of a coaxial connector on the broad side of a rectangular waveguide with the center conductor ex-tended as a probe into the waveguide, with one end of the guide ending in a short cir-cuit, like Figure 1. Since the structure is well-known, design may be too ambitious a term,

Rectangular Waveguide to Coax Transition Design

Also, while we are discussing rectangular waveguide on this page, the techniques could be applied to circular or double-ridged waveguide as well. Right-angle transitions. These are also known E-plane transitions, or orthogonal transitions. Waveguide is interfaced with coaxial cable by using a simple antenna probe reaching into the waveguide to excite the preferred TE₀₁ waveguide mode. A "back-short" is positioned some distance "D" away from the probe.

A broadband coax-waveguide transition for the high power test of the PEP-II RF cavity HOM waveguides has been studied. The design requirements are that it must have a VSWR less than 2 over the frequency range 714MHz to 2500MHz and transmit 10kW average power from a 250mm * 25.4mm rectangular waveguide to a 50 Ohm coaxial line.

In this example using WR-75 waveguide, the cutoff frequency is 7.87 GHz. The standard operating band is 10 to 15 GHz, which is not that far from the cutoff frequency. The only choice to study frequencies down to 10 GHz is to use a narrow frequency band of 10 to 15 GHz.
