to industry giants  
throughout the world.

**Trigonometry  
Practice Problems  
With Solutions**

Here we have a right triangle with one  $52.5$  degree angle (half of  $105$  degrees) and a hypotenuse that is  $6370$  km long. We need to find the adjacent side, which is the approximate radius of the outer core, so

Two different Cases?  
Or really just one?  
There are two different  
situations when you  
use this formula. But  
really, there is just one  
case .. Just look at it:  
You can always  
immediately look at a  
triangle and tell  
whether or not you can  
use the Law of Sines --  
you need 3  
measurements: either

BC represents distance of the building from the point of observation. In the right triangle ABC, the side which is opposite to the angle  $60^\circ$  is known as opposite side (AB), the side which is opposite to  $90^\circ$  is called hypotenuse side (AC) and the remaining side is called adjacent side (BC).
